

EAD Assignment related Lecture Discussion (5 September 2026)

1. **Develop a complete working system** consisting of a **Web API, a web application, and an Android mobile application** that work together.
2. **Host the Web API in IIS** on a laptop or computer.
3. **Build and host the web application separately from the Web API.** Configure the web application to access functionality through the API.
4. **Connect the mobile device and server laptop to the same LAN or hotspot.** Configure the mobile application to **access the IIS-hosted API using its URL.**
5. **Prepare a local setup for the presentation.** **Avoid depending on external hosting or internet access to demonstrate the system.**
6. **Ensure the web application can be accessed from another laptop,** as evaluators may request this during the demonstration.
7. **Prioritize Kotlin for developing the native Android application.** Treat Java as an accepted alternative. Do not use Flutter or other unapproved mobile frameworks.
8. **Include SQLite in the mobile application** for local user/login information and other required application data. Support use by more than one user.
9. **Use available free tools and services.** Do not purchase Azure APIs, cloud hosting, or other services specifically for this assignment.
10. **Ensure IIS, both client applications, and network connections work** during the presentation. Do not expect extensions for technical failures.
11. **Understand the entire implementation and be prepared to explain it** when the evaluation panel asks questions.
12. **Read the assignment and start development early.** Do not leave implementation until the final one or two days.
13. **Check LMS for the lecturer's final technology requirements.**
